

A Vitamin Formulation Guide To Support Genotype-Directed Eye Vitamin Selection

There is a growing list of Eye Vitamin suppliers who have developed formulations to serve Genotype-Directed Supplementation as per the Vita Risk®/Macula Risk® PGx genetic testing service.

AREDS/AREDS2 eye supplements are the standard of care for patients diagnosed with Dry Age Related Macular Degeneration (AMD). The pivotal controlled clinical trials have shown that these AREDS-based preparations with at least 25 mg of zinc per day can prevent or delay the progression to advanced AMD with vision loss in most patients.

This average benefit (25% positive benefit) is the result of varying responses from AREDS patients with different AMD genetic profiles. Some patients will benefit with as much as an 85% reduction in risk while others may experience a deleterious effect from AREDS-based formulations. The zinc component of AREDS has been shown to offer significant benefit in most patients but a negative result in others. Patients may benefit from taking the appropriate eye vitamin supplement determined by his or her combined CFH and ARMS2 genotype.^{1,2}

The purpose of this guide is to allow your practice to view the current list of vitamin manufacturers now offering the appropriate formulation to suit each specific patient.
